Vanishing theorems of vector bundles with singular Hermitian metrics

Masataka Iwai

The University of Tokyo

Geometry seminar in Nagoya Univ. May 29, 2018
Theorem (Kodaira 53)

Let $X$ be a compact Kähler manifold and $L$ be a holomorphic line bundle. Assume $L$ has a smooth metric with positive curvature. Then for any $q \geq 1$

$$H^q(X, K_X \otimes L) = 0.$$
Theorem (Kodaira 53)

Let $X$ be a compact Kähler manifold and $L$ be a holomorphic line bundle. Assume $L$ has a smooth metric with positive curvature. Then for any $q \geq 1$

$$H^q(X, K_X \otimes L) = 0.$$ 

By Kodaira’s vanishing theorem, $L$ is ample if and only if $L$ has a smooth metric with positive curvature.
Theorem (Kawamata 82, Viehweg 82)

Let $X$ be a smooth projective variety and $L$ be a nef and big line bundle. Then for any $q \geq 1$

$$H^q(X, K_X \otimes L) = 0.$$
Theorem (Kawamata 82, Viehweg 82)

Let $X$ be smooth projective variety and $L$ be a nef and big line bundle. Then for any $q \geq 1$

$$H^q(X, K_X \otimes L) = 0.$$ 

By Kawamata-Viehweg vanishing theorem (and so on), we have Kawamata-Shokurov base point free theorem, Mori’s cone theorem and so on.
Let $X$ be smooth projective variety and $L$ be a nef and big line bundle. Then for any $q \geq 1$

$$H^q(X, K_X \otimes L) = 0.$$

- By Kawamata-Viehweg vanishing theorem (and so on), we have Kawamata-Shokurov base point free theorem, Mori’s cone theorem and so on.
- $L$ is nef $\iff \forall C \subset X: \text{curve}, L.C \geq 0$
- $L$ is big $\iff \limsup_{k \to +\infty} \frac{\dim H^0(X, L^k)}{k^n} > 0$
Before the next results...
Before the next results...

- $h$ is a singular Hermitian metric (sHm) on $L$
  \[ h \overset{\text{def}}{=} \exists \text{ a smooth metric } h_0 \text{ and } \varphi \in L^1_{\text{loc}}(X) \text{ s.t. } h = h_0 e^{-\varphi} \]
- $\sqrt{-1}\Theta_{L,h} := \sqrt{-1}\Theta_{L,h_0} + \sqrt{-1}\partial\bar{\partial}\varphi$ for any sHm $h$. 
Before the next results...

- $h$ is a singular Hermitian metric (sHm) on $L$ defined as:
  \[ h \iff \exists \text{ a smooth metric } h_0 \text{ and } \varphi \in L^1_{loc}(X) \text{ s.t. } h = h_0 e^{-\varphi} \]
- \[ \sqrt{-1}\Theta_{L,h} := \sqrt{-1}\Theta_{L,h_0} + \sqrt{-1}\partial\bar{\partial}\varphi \] for any sHm $h$.
- The multiplier ideal sheaf $\mathcal{J}(h)$ of $h$ is defined as:
  \[ \mathcal{J}(h)_x := \{ f \in O_{X,x}; \exists U \ni x, \int_U |f|^2 e^{-\varphi} d\lambda < \infty \}, \]

where $d\lambda$ is the standard Lesbegue measure.
Before the next results...

- $h$ is a singular Hermitian metric (sHm) on $L$
  
  \[ h \overset{\text{def}}{=} \exists \text{ a smooth metric } h_0 \text{ and } \varphi \in L^1_{\text{loc}}(X) \text{ s.t. } h = h_0 e^{-\varphi} \]

- \( \sqrt{-1}\Theta_{L,h} := \sqrt{-1}\Theta_{L,h_0} + \sqrt{-1}\partial\bar{\partial}\varphi \) for any sHm $h$.

- The multiplier ideal sheaf $\mathcal{J}(h)$ of $h$

  \[
  \mathcal{J}(h)_x := \{ f \in O_{X,x}; \exists U \ni x, \int_U |f|^2 e^{-\varphi} d\lambda < \infty \},
  \]

  where $d\lambda$ is the standard Lesbegue measure.

- The multiplier ideal sheaf $\mathcal{J}(h)$ is coherent sheaf if \( \sqrt{-1}\Theta_{L,h} \geq 0 \) (this is NOT trivial).
Theorem (Nadel 89. (cf. Demailly 82) )

Let \((X, \omega)\) be a compact Kähler manifold and \(L\) be a holomorphic line bundle. Assume \(h\) has a sHm on \(L\) such that \(\sqrt{-1} \Theta_{L,h} \geq \epsilon \omega\) in the sense of current for some \(\epsilon \in \mathbb{R}_{>0}\). Then for any \(q \geq 1\)

\[ H^q(X, K_X \otimes L \otimes \mathcal{J}(h)) = 0. \]
Theorem (Nadel 89. (cf. Demailly 82) )

Let \((X, \omega)\) be a compact Kähler manifold and \(L\) be a holomorphic line bundle. Assume \(h\) has a sHm on \(L\) such that \(\sqrt{-1}\Theta_{L,h} \geq \epsilon \omega\) in the sense of current for some \(\epsilon \in \mathbb{R}_{>0}\). Then for any \(q \geq 1\)

\[
H^q(X, K_X \otimes L \otimes \mathcal{J}(h)) = 0.
\]

By Nadel vanishing theorem, we have Angehrn-Siu’s theorem (if \(L\) is ample line bundle then \(K_X \otimes L^{\frac{n^2+n}{2} + 1}\) is globally generated) and so on.
**Remarks**

- \( L \) is nef \( \overset{\text{def}}{\iff} \forall C \subset X: \text{curve}, L.C \geq 0 \)
- \( \iff \forall \epsilon > 0, \exists h_\epsilon \text{ smooth metric, s.t. } \sqrt{-1} \Theta_{L,h} + \epsilon \omega \geq 0. \)
Remarks

- \( L \) is nef \( \overset{\text{def}}{\iff} \forall C \subset X: \text{curve}, L.C \geq 0 \)
  \( \iff \forall \varepsilon > 0, \exists h_\varepsilon \text{ smooth metric, s.t. } \sqrt{-1} \Theta_{L,h} + \varepsilon \omega \geq 0. \)

- \( L \) is big \( \overset{\text{def}}{\iff} \limsup_{k \to +\infty} \frac{\dim H^0(X, L^k)}{k^n} > 0 \)
  \( \iff \exists \varepsilon > 0, \exists h \text{ sHm, s.t. } \sqrt{-1} \Theta_{L,h} - \varepsilon \omega \geq 0 \) in the sense of current.
Remarks

- $L$ is nef $\overset{\text{def}}{\iff} \forall C \subset X: \text{curve}, L.C \geq 0$
  $\iff \forall \epsilon > 0, \exists h_\epsilon$ smooth metric, s.t. $\sqrt{-1} \Theta_{L,h} + \epsilon \omega \geq 0$.

- $L$ is big $\overset{\text{def}}{\iff} \limsup_{k \to +\infty} \frac{\dim H^0(X,L^\otimes k)}{k^n} > 0$
  $\iff \exists \epsilon > 0, \exists h$ sHm, s.t. $\sqrt{-1} \Theta_{L,h} - \epsilon \omega \geq 0$ in the sense of current.

- Nadel vanishing $\Rightarrow$ Kawamata-Viehweg vanishing $\Rightarrow$ Kodaira vanishing
We have many applications by using vanishing theorems.
We have many applications by using vanishing theorems.

**Aim**

Prove that vanishing theorems in more general setting.

In this talk, we show that vanishing theorems of vector bundles with sHm.
More explicitly...

**Aim**

Prove that for any $q \geq 1$ and any vector bundle $E$,

$$H^q(X, K_X \otimes E(h)) = 0$$

with some assumption (positivity of metric).
More explicitly...

**Aim**

Prove that for any $q \geq 1$ and any vector bundle $E$,

$$H^q(X, K_X \otimes E(h)) = 0$$

with some assumption (positivity of metric).

- $h$ is a sHm of a vector bundle $E$.
- $E(h)$ is a higher rank analogy of multiplier ideal sheaf.
- $h$ has "some positivity".
Positivity of metric -smooth case-

\((X, \omega)\) : a compact Kähler manifold with a Kähler form.

\((E, h)\) : a holomorphic vector bundle of rank \(r\) with a smooth metric

\((V; z_1, \ldots, z_n)\) : a system of local coordinate near \(x \in X\).

\((e_1, \ldots, e_r)\) : a local orthogonal holomorphic frame of \(E\).
Positivity of metric smooth case-

$$(X, \omega)$$ : a compact Kähler manifold with a Kähler form.  
$$(E, h)$$ : a holomorphic vector bundle of rank $r$ with a smooth metric 

$$(V; z_1, \ldots, z_n)$$ : a system of local coordinate near $x \in X$.  
$$(e_1, \ldots, e_r)$$ : a local orthogonal holomorphic frame of $E$. The Chern curvature tensor of $h$:

$$\sqrt{-1} \Theta_{E,h} = \sqrt{-1} \sum_{1 \leq j, k \leq n, 1 \leq \lambda, \mu \leq r} c_{jk\lambda\mu} \, dz_j \wedge d\bar{z}_k \otimes e^*_\lambda \otimes e_\mu$$

Kähler form : $\omega = \sqrt{-1} \sum_{1 \leq j, k \leq n} \omega_{jk} \, dz_j \wedge d\bar{z}_k$
Definition and Notation

$$\sqrt{-1} \Theta_{E,h} \geq_{Nak} (\leq_{Nak}) C \omega \otimes id_E \iff$$

$$\sum_{1 \leq j, k \leq n, 1 \leq \lambda, \mu \leq r} c_{jk \lambda \mu} u_{j \lambda} \bar{u}_{k \mu} - C \sum_{1 \leq j, k \leq n, 1 \leq \lambda \leq r} \omega_{jk} u_{j \lambda} \bar{u}_{k \lambda} \geq (\leq) 0$$

for any $$u = \sum_{1 \leq j \leq n, 1 \leq \lambda \leq r} u_{j \lambda} dz_j \otimes e_\lambda \in T_x X \otimes E_x$$ and any $$x \in X.$$
Definition and Notation

\[
\sqrt{-1} \Theta_{E,h} \geq_{\text{Nak}} (\leq_{\text{Nak}}) C \omega \otimes \text{id}_E \iff \\
\sum_{1 \leq j, k \leq n, 1 \leq \lambda, \mu \leq m} c_{j,k,l,m} u_{j,\lambda} \bar{u}_{k,\mu} - C \sum_{1 \leq j, k \leq n, 1 \leq \lambda \leq m} \omega_{j,k} u_{j,\lambda} \bar{u}_{k,\lambda} \geq (\leq) 0
\]

for any \( u = \sum_{1 \leq j \leq n, 1 \leq \lambda \leq m} u_{j,\lambda} dz_j \otimes e_{\lambda} \in T_x X \otimes E_x \) and any \( x \in X \).

\[
\sqrt{-1} \Theta_{E,h} \geq_{\text{Grif}} (\leq_{\text{Grif}}) C \omega \otimes \text{id}_E \iff \\
\sum_{1 \leq j, k \leq n, 1 \leq \lambda, \mu \leq m} c_{j,k,l,m} \xi_j a_{\lambda} \bar{\xi}_k \bar{a}_{\mu} - C \sum_{1 \leq j, k \leq n, 1 \leq \lambda \leq m} \omega_{j,k} \xi_j \bar{\xi}_k |a_{\lambda}|^2 \geq (\leq) 0
\]

for any \( u = \sum_{1 \leq j \leq n, 1 \leq \lambda \leq m} \xi_j a_{\lambda} dz_j \otimes e_{\lambda} \in T_x X \otimes E_x \) and any \( x \in X \).
\[ \sqrt{-1} \Theta_{E,h} \geq_{Nak} (\leq_{Nak}) 0 \overset{\text{def}}{\iff} h \text{ is Nakano semipositive (seminegative)}. \]

\[ \sqrt{-1} \Theta_{E,h} \geq_{Grif} (\leq_{Grif}) 0 \overset{\text{def}}{\iff} h \text{ is Griffiths semipositive (seminegative)}. \]
\[ \sqrt{-1} \Theta_{E,h} \geq_{Nak} (\leq_{Nak}) 0 \overset{\text{def}}{\iff} h \text{ is Nakano semipositive (seminegative).} \]
\[ \sqrt{-1} \Theta_{E,h} \geq_{Grif} (\leq_{Grif}) 0 \overset{\text{def}}{\iff} h \text{ is Griffiths semipositive (seminegative).} \]
Nakano semipositive \Rightarrow Griffiths semipositive
\[ \sqrt{-1} \Theta_{E,h} \geq_{\text{Nak}} (\leq_{\text{Nak}}) 0 \overset{\text{def}}{\iff} h \text{ is Nakano semipositive (seminegative).} \]
\[ \sqrt{-1} \Theta_{E,h} \geq_{\text{Grif}} (\leq_{\text{Grif}}) 0 \overset{\text{def}}{\iff} h \text{ is Griffiths semipositive (seminegative).} \]
Nakano semipositive \Rightarrow Griffiths semipositive

**Theorem (Nakano 55)**

Let \( X \) be a compact Kähler manifold and \( E \) be a holomorphic vector bundle. Assume \( E \) has a smooth metric \( h \) such that
\[ \sqrt{-1} \Theta_{E,h} \geq_{\text{Nak}} C \omega \otimes \text{id}_E \text{ for some } C \in \mathbb{R}_{>0}. \]
Then for any \( q \geq 1 \)

\[ H^q(X, K_X \otimes E) = 0. \]
\[
\sqrt{-1} \Theta_{E,h} \geq_{Nak} C \omega \otimes \text{id}_E \quad \text{for some } C \in \mathbb{R}_{>0}.
\]

Then for any \( q \geq 1 \)

\[ H^q(X, K_X \otimes E) = 0. \]

Nakano positivity is useful of vanishing theorems. (Griffiths positivity is too weak not to vanish the cohomology.)
Definition of sHm on vector bundle

We adopt the definition by Hacon, Popa, and Schnell. (This definition is easy to understand)
We adopt the definition by Hacon, Popa, and Schnell. (This definition is easy to understand)

**Definition (Hacon-Popa-Schnell 17)**

A *singular Hermitian inner product* on a finite dimensional complex vector space $V$ is a function $|−|_h : V \rightarrow [0, +\infty]$ with the following properties:

1. $|\alpha \cdot v|_h = |\alpha||v|_h : \forall \alpha \in \mathbb{C} \setminus 0, \forall v \in V$
2. $|0|_h = 0$
3. $|v + w|_h \leq |v|_h + |w|_h : \forall v, w \in V$
4. $|v + w|_h^2 + |v - w|_h^2 = |v|_h^2 + |w|_h^2 : \forall v, w \in V$
Definition (Hacon-Popa-Schnell 17)

Let $X$ be a complex manifold $E$ be a holomorphic vector bundle.

A **singular Hermitian metric** (sHm) on $E$ is a function $h$ that associates to any $x \in X$ a singular Hermitian inner product $|-_h, x : E_x \to [0, +\infty]$ with the following properties:

1. $|v|_{h,x} = 0 \iff v = 0$ for almost everywhere $x$

2. $|v|_{h,x} < +\infty : \forall v \in E_x$ for almost everywhere $x$

3. For any open $U$ and any $s \in H^0(U, E)$,

   $|s|_h : U \to [0, +\infty] ; \ x \to |s(x)|_{h,x}$

   is measurable function.
Definition (Păun-Takayama 14, Hacon-Popa-Schnell 17)

1. A sHm $h$ on $E$ is **Griffiths seminegative** if the function $\log |u|^2_h$ is plurisubharmonic for any local section $u$ of $E$.

2. A sHm $h$ on $E$ is **Griffiths semipositive** if the dual metric $h^* = t h^{-1}$ on the dual vector bundle $E^*$ is Griffiths seminegative.
Definition (Păun-Takayama 14, Hacon-Popa-Schnell 17)

1. A sHm $h$ on $E$ is **Griffiths seminegative** if the function $\log |u|^2_h$ is plurisubharmonic for any local section $u$ of $E$.

2. A sHm $h$ on $E$ is **Griffiths semipositive** if the dual metric $h^* = t h^{-1}$ on the dual vector bundle $E^*$ is Griffiths seminegative.

- $\varphi \in L^1_{\text{loc}}$ is plurisubharmonic iff $\sqrt{-1} \partial \bar{\partial} \varphi \geq 0$ in the sense of current.
Definition (Păun-Takayama 14, Hacon-Popa-Schnell 17)

1. A sHm $h$ on $E$ is **Griffiths seminegative** if the function $\log |u|^2_h$ is plurisubharmonic for any local section $u$ of $E$.

2. A sHm $h$ on $E$ is **Griffiths semipositive** if the dual metric $h^* = t h^{-1}$ on the dual vector bundle $E^*$ is Griffiths seminegative.

- $\varphi \in L^1_{loc}$ is plurisubharmonic iff $\sqrt{-1} \partial \bar{\partial} \varphi \geq 0$ in the sense of current.

- If $E$ is a line bundle, $h$ is Griffiths semipositive sHm iff $\sqrt{-1} \Theta_{E,h} \geq 0$ in the sense of current.
Whenever \( h \) is smooth, \( h \) is Griffiths seminegative (in the usual sense) iff \( \log |u|^2_h \) is plurisubharmonic for any local section \( u \) of \( E \).
Whenever $h$ is smooth, $h$ is Griffiths seminegative (in the usual sense) iff $\log |u|^2_h$ is plurisubharmonic for any local section $u$ of $E$.

(Raufi 15) A Griffiths semipositive sHm DOES NOT always have a curvature current.
Whenever $h$ is smooth, $h$ is Griffiths seminegative (in the usual sense) iff $\log |u|^2_h$ is plurisubharmonic for any local section $u$ of $E$.

(Raufi 15) A Griffiths semipositive sHm DOES NOT always have a curvature current.

Nowadays, Nakano positive sHm is NOT defined. (We don’t have a ”good” definition of Nakano positive sHm.)
History

- (deCataldo 98) deCataldo defined sHm on vector bundles by using approximation of smooth Hermitian metrics.
- (Berndtsson-Păun 08) Berndtsson and Păun defined sHm on vector bundles in another way.
Introduction
sHm on vector bundles
Vanishing theorems of VB with sHm

History

(deCataldo 98) deCataldo defined sHm on vector bundles by using approximation of smooth Hermitian metrics.

(Berndtsson-Păun 08) Berndtsson and Păun defined sHm on vector bundles in another way.

(Păun-Takayama 14) $f_*(mK_{X/Y})$ has a Griffith semipositive sHm called "Narasimhan-Simha" metric, for any surjective projective morphism $f : X \to Y$ between smooth complex manifold with connected fibers such that $f_*(mK_{X/Y}) \neq 0$. 
Theorem (Cao-Păun 17)

Iitaka’s $C_{n,m}$ conjecture holds if the base space is an Abelian variety, i.e. for any surjective morphism $f : X \to Y$ with connected fiber between smooth projective variety such that $Y$ is an Abelian variety,

$$\kappa(X) \geq \kappa(F)$$

holds where $F$ is a generic fiber of $f$. 
Theorem (Cao-Păun 17)

Iitaka’s $C_{n,m}$ conjecture holds if the base space is an Abelian variety, i.e. for any surjective morphism $f : X \to Y$ with connected fiber between smooth projective variety such that $Y$ is an Abelian variety,

$$\kappa(X) \geq \kappa(F)$$

holds where $F$ is a generic fiber of $f$.

If $H^0(X, K_X^k) = 0$ for all $k$, $\kappa(X) := -\infty$. Otherwise,

$$\kappa(X) := \max\{a \in \{0, 1, \cdots n\} : \limsup_{k \to +\infty} \frac{\dim H^0(X, K_X^k)}{k^a} > 0\}.$$
(Hacon-Popa-Schnell 17) Hacon Popa and Schnell took a survey of sHm of vector bundles and Păun-Takayama’s result. They gave a simplified proof of Cao and Păun’s result by using GV sheaf and sHm of vector bundles.
Definition

Let \((E, h)\) be a vector bundle with sHm. The sheaf of locally square integrable holomorphic sections of \(E\) with respect to \(h\) is defined by

\[ E(h)_x = \{ f_x \in E(x) : |f_x|^2_h \in L^1_{loc} \} \quad x \in X, \]

where \(E(x)\) the stalk of \(E\) at \(x\), defined by \(\lim_{x \to U} H^0(U, E)\).

- \(E(h)\) is a higher rank analogy of a multiplier ideal sheaf.
Introduction
sHm on vector bundles
Vanishing theorems of VB with sHm

Higher rank analogy of multiplier ideal sheaf

Definition

Let \((E, h)\) be a vector bundle with sHm. The sheaf of locally square integrable holomorphic sections of \(E\) with respect to \(h\) is defined by

\[
E(h)_x = \{ f_x \in E(x) : |f_x|^2_h \in L^1_{loc} \} \quad x \in X,
\]

where \(E(x)\) the stalk of \(E\) at \(x\), defined by \(\lim_{x \in U} H^0(U, E)\).

- \(E(h)\) is a higher rank analogy of a multiplier ideal sheaf.
- We don’t know whether this sheaf is coherent.
Problems

Let $(E, h)$ be a vector bundle with sHm.

1. Is $E(h)$ a coherent sheaf?

2. Prove that for any $q \geq 1$ and any vector bundle $E$,

$$H^q(X, K_X \otimes E(h)) = 0$$

if $h$ has some positivity.
**Previous research**

**Theorem (deCataldo 98)**

Let \((X, \omega)\) be a compact Kähler manifold with a Kähler form and \((E, h)\) be a vector bundle with a sHm. We assume the following conditions:

1. There exists a proper analytic subset \(Z\) such that \(h\) is smooth on \(X \setminus Z\).
2. There exists an approximate sequence of smooth Hermitian metrics \(\{h^\mu\}_{\mu=1}^\infty\) such that \(h^\mu \uparrow h\) pointwise.
3. \(\sqrt{-1} \Theta_{E, h^\mu - \varepsilon \omega \otimes \text{Id}_E} \geq \text{Nak}_0\) for some positive constant \(\varepsilon\).

Then \(E(h)\) is a coherent sheaf.

For \(q \geq 1\), \(H^q(X, K_X \otimes E(h)) = 0\) holds.
Previous research

**Theorem (deCataldo 98)**

Let \((X, \omega)\) be a compact Kähler manifold with a Kähler form and \((E, h)\) be a vector bundle with a sHm. We assume the following conditions:

1. There exists a proper analytic subset \(Z\) such that \(h\) is smooth on \(X \setminus Z\).

Theorem (I. 18)

Let \((X, \omega)\) be a compact Kähler manifold and \((E, h)\) be a holomorphic vector bundle on \(X\) with a sHm. We assume the following conditions.

1. There exists a proper analytic subset \(Z\) such that \(h\) is smooth on \(X \setminus Z\).
2. \(he^{-\zeta}\) is a Griffiths semipositive sHm on \(E\) for some continuous function \(\zeta\) on \(X\).
3. There exists \(\epsilon \in \mathbb{R}_{>0}\) such that
\[
\sqrt{-1}\Theta_{E,h} - \epsilon \omega \otimes \text{Id}_E \geq_{\text{Nak}} 0 \quad \text{on} \quad X \setminus Z.
\]

Then \(H^q(X, K_X \otimes E(h)) = 0\) holds for any \(q \geq 1\).
Kollár type injectivity theorems

**Theorem**

Let \((X, \omega)\) be a compact Kähler manifold, \((E, h)\) be a holomorphic vector bundle on \(X\) with a sHm and \((L, h_L)\) be a holomorphic line bundle with a smooth metric. We assume the following conditions.

1. There exists a proper analytic subset \(Z\) such that \(h\) is smooth on \(X \setminus Z\).
2. \(he^{-\zeta}\) is a Griffiths semipositive sHm on \(E\) for some continuous function \(\zeta\) on \(X\).
3. \(\sqrt{-1}\Theta_{E,h} \geq_{\text{Nak}} 0\) on \(X \setminus Z\).
4. There exists \(\epsilon \in \mathbb{R}_{>0}\) such that \(\sqrt{-1}\Theta_{E,h} - \epsilon \sqrt{-1}\Theta_{L,h_L} \otimes \text{Id}_E \geq_{\text{Nak}} 0\) on \(X \setminus Z\).
Let $s$ be a non zero section of $L$. Then for any $q \geq 0$, the multiplication homomorphism

$$\times s : H^q(X, K_X \otimes E(h)) \to H^q(X, K_X \otimes L \otimes E(h))$$

is injective.
Kollár-Ohsawa type vanishing theorems

Theorem (I. 18)

Let $(X, \omega)$ be a compact Kähler manifold and $(E, h)$ be a holomorphic vector bundle on $X$ with a sHm. Let $\pi : X \to W$ be a proper surjective holomorphic map to an analytic space with a Kähler form $\sigma$. We assume the following conditions.

1. There exists a proper analytic subset $Z$ such that $h$ is smooth on $X \setminus Z$.
2. $h e^{-\zeta}$ is a Griffiths semipositive sHm on $E$ for some continuous function $\zeta$ on $X$.
3. $\sqrt{-1} \Theta_{E, h} - \pi^* \sigma \otimes \text{Id}_E \geq_{\text{Nak}} 0$ on $X \setminus Z$.

Then $H^q(W, \pi_*(K_X \otimes E(h))) = 0$ holds for any $q \geq 1$. 
We DO NOT use approximation methods.

We solve $\bar{\partial}$-equation by ignoring analytic set $Z$.

After all, we solve $\bar{\partial}$-equation $\bar{\partial} g = f$ with some weight (sHm) on $X$ for $\bar{\partial}$-closed $(n, q)$-form $f$.

However we do not treat this equation on $X$.

→ We consider this equation on $X \setminus Z$.

\[ \text{s.t. } \int_Y |f|^2_{\omega',h} dV_{\omega'} < +\infty \}, \]

**Theorem**

\[ H^q(X, K_X \otimes E(h)) \cong \frac{L_{n,q}^2(Y, E)_{\omega',h} \cap \text{Ker} \bar{\partial}}{\text{Im} \bar{\partial}} \]

for any \( q \geq 0. \)
We consider Čech cohomology \((K_X \otimes E(h) \text{ is coherent.})\)
We consider Čech cohomology \((K_X \otimes E(h) \text{ is coherent.})\).

(⇒)

We consider restriction to \(Y\) and only path together by using partition of unity.
We consider Čech cohomology ($K_X \otimes E(h)$ is coherent.)

(⇒)
We consider restriction to $Y$ and only path together by using partition of unity.

(⇐)
By metric condition (1) and (3), we can restore to $q$-cochain outside $Z$.
By metric condition (2), it extend to $X$. 
Applications

Question

How many sHm $h$ on vector bundles satisfying the following conditions (★):

1. There exists a proper analytic subset $Z$ such that $h$ is smooth on $X \setminus Z$.
2. $-\zeta$ is a Griffiths semipositive sHm on $E$ for some continuous function $\zeta$ on $X$.
3. There exists $\epsilon \in \mathbb{R}$ such that $\sqrt{-1} \Theta_{E}, h - \epsilon \omega \otimes \text{Id}_{E} \geq \text{Nak}_{0}$ on $X \setminus Z$.

Even if $E$ is a vector bundle, do the same things hold?
Definition (Viehweg 83, Nakayama 04)

1. *E* is **dd-ample at** \( x \in X \) ("ample modulo double-duals") if there exist \( b \in \mathbb{N}_{>0} \) and an ample line bundle *A* on *X* such that \( \text{Sym}^b(E) \otimes A^{-1} \) is globally generated at \( x \).
Definition (Viehweg 83, Nakayama 04)

1. *E is dd-ample at* $x \in X$ (”ample modulo double-duals”) *if there exist* $b \in \mathbb{N}_{>0}$ *and an ample line bundle* $A$ *on* $X$ *such that* $\text{Sym}^b(E) \otimes A^{-1}$ *is globally generated at* $x$.

2. *E is weakly positive at* $x \in X$ *if for any* $a \in \mathbb{N}_{>0}$ *and for any ample line bundle* $A$, *there exists* $b \in \mathbb{N}_{>0}$ *such that* $\text{Sym}^{ab}(E) \otimes A^b$ *is globally generated at* $x$. 

vector bundle case -Viehweg’s weakly positivity-
Definition (Viehweg 83, Nakayama 04)

1. $E$ is *dd-ample at* $x \in X$ ("ample modulo double-duals") if there exist $b \in \mathbb{N}_{>0}$ and an ample line bundle $A$ on $X$ such that $\text{Sym}^b(E) \otimes A^{-1}$ is globally generated at $x$.

2. $E$ is *weakly positive at* $x \in X$ if for any $a \in \mathbb{N}_{>0}$ and for any ample line bundle $A$, there exists $b \in \mathbb{N}_{>0}$ such that $\text{Sym}^{ab}(E) \otimes A^b$ is globally generated at $x$.

3. $E$ is *weakly positive in the sense of Nakayama* if there exists a point $x \in X$ such that $E$ is weakly positive at $x$. 
If $E$ is line bundle,

- $E$ is dd ample at some point $\iff E$ is big
- $E$ is weakly positive in the sense of Nakayama $\iff E$ is pseudo-effective
If $E$ is line bundle,

- $E$ is dd ample at some point $\iff E$ is big
- $E$ is weakly positive in the sense of Nakayama $\iff E$ is pseudo-effective

dd ample at some point $\implies$ weakly positive in the sense of Nakayama.
If $E$ is line bundle,

- $E$ is dd ample at some point $\iff E$ is big
- $E$ is weakly positive in the sense of Nakayama $\iff E$ is pseudo-effective

dd ample at some point $\implies$ weakly positive in the sense of Nakayama.

**Theorem (Păun-Takayama 14)**

*If $E$ has a Griffith semipositive sHm, then $E$ is weakly positive in the sense of Nakayama.*
Theorem (I. 18)

The following are equivalent.

(A) $E$ is weakly positive in the sense of Nakayama.
Theorem (I. 18)

The following are equivalent.

(A) $E$ is weakly positive in the sense of Nakayama.

(B) There exists an ample line bundle $A$ such that $\text{Sym}^k(E) \otimes A$ has a Griffiths semipositive $\text{sHm} h_k$ for any $k \in \mathbb{N}_{>0}$. Moreover, for any $k \in \mathbb{N}_{>0}$, there exists a proper Zariski closed set $Z_k \subset X$ such that $h_k$ is smooth and Nakano semipositive outside $Z_k$.
Theorem (I. 18)

The following are equivalent.

(A) \( E \) is weakly positive in the sense of Nakayama.

(B) There exists an ample line bundle \( A \) such that \( \text{Sym}^k(E) \otimes A \) has a Griffiths semipositive sHm \( h_k \) for any \( k \in \mathbb{N}_{>0} \). Moreover, for any \( k \in \mathbb{N}_{>0} \), there exists a proper Zariski closed set \( Z_k \subset X \) such that \( h_k \) is smooth and Nakano semipositive outside \( Z_k \).

(C) There exists an ample line bundle \( A \) such that \( \text{Sym}^k(E) \otimes A \) has a Griffiths semipositive sHm \( h_k \) for any \( k \in \mathbb{N}_{>0} \).
Theorem (I. 18)

The following are equivalent.

(A) $E$ is weakly positive in the sense of Nakayama.

(B) There exists an ample line bundle $A$ such that $\text{Sym}^k(E) \otimes A$ has a Griffiths semipositive $\text{sh}m$ $h_k$ for any $k \in \mathbb{N}_{>0}$. Moreover, for any $k \in \mathbb{N}_{>0}$, there exists a proper Zariski closed set $Z_k \subset X$ such that $h_k$ is smooth and Nakano semipositive outside $Z_k$.

(C) There exists an ample line bundle $A$ such that $\text{Sym}^k(E) \otimes A$ has a Griffiths semipositive $\text{sh}m$ $h_k$ for any $k \in \mathbb{N}_{>0}$.

The similar things hold if $E$ is dd ample at some point.
We concrete the basic theory of vector bundles with sHm without using curvature current of sHm (c.f. chapter 5,6 in Demailly’s book)
Outlook

- We concretize the basic theory of vector bundles with sHm without using curvature current of sHm (c.f. chapter 5,6 in Demailly’s book)
- On the other hand, Raufi et al. defined the Chern class of sHm by using curvature current.
Outlook

- We concretize the basic theory of vector bundles with sHm without using curvature current of sHm (c.f. chapter 5,6 in Demailly’s book).
- On the other hand, Raufi et al. defined the Chern class of sHm by using curvature current.
- Cao and Höring proved the structure theorem with nef anticanonical divisor by using Paun-Takayama’s result: $f_*(mK_{X/Y})$ has a Griffiths semipositive sHm.
We concrete the basic theory of vector bundles with sHm without using curvature current of sHm (c.f. chapter 5,6 in Demailly’s book).

On the other hand, Raufi et al. defined the Chern class of sHm by using curvature current.

Cao and Höring proved the structure theorem with nef anticanonical divisor by using Paun-Takayama’s result: \( f_*(mK_{X/Y}) \) has a Griffiths semipositive sHm.

Question

Find other applications of vector bundles with sHm.
